# 1 Welcome to MAIA

Welcome! MAIA — Monitoring, Assistant, Intelligence & Automation — is your team's intelligent platform for keeping data pipelines healthy. Instead of manually reviewing log files when something breaks, MAIA watches your pipelines continuously, tells you exactly what went wrong, and often fixes it automatically.

| What MAIA Does For You                   | What You No Longer Need To Do                 |
|------------------------------------------|-----------------------------------------------|
| ■ Monitors all job pipelines 24/7        | ■ Manually scan log files every morning       |
| ■ Classifies failures by error type      | ■ Guess what type of error occurred           |
| ■ Suggests the right fix with confidence | ■ Research fixes from scratch each time       |
| ■ Fixes known issues automatically       | ■ Repeat the same manual fixes daily          |
| ■ Keeps a full audit trail               | ■ Maintain manual fix records in spreadsheets |

## 2 Understanding Your Role

As an operator, your daily job with MAIA is straightforward. MAIA does the heavy lifting — you provide human judgment where it matters most.

| Your Responsibility                  | How Often                  | Where in MAIA                      |
|--------------------------------------|----------------------------|------------------------------------|
| Check for new failures               | Daily (or when alerted)    | Dashboard → Failures               |
| Review AI recommendations            | When failures are detected | Failure Detail screen              |
| Approve or reject fix suggestions    | As needed                  | Recommendations screen             |
| Set auto-heal for recurring patterns | Once per error type        | Recommendations → Auto-Heal toggle |
| Review audit log for compliance      | Weekly or on request       | Audit Log screen                   |

■ You do NOT need database access or technical knowledge of the pipeline code to use MAIA effectively.

# 3 Your First Login & Dashboard Tour

When you log in, you land on the Dashboard. This is your command centre — it shows you the current health of all monitored pipelines at a glance.

Screen 1 — Dashboard Overview with annotated callouts

## What you see on the Dashboard:

|   |                                                                                                                                                                     |
|---|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | <b>KPI Cards (top row)</b><br>Quick summary of Active Failures, Pending Review items, Auto-Healed count today, and overall uptime. Red numbers need your attention. |
| 2 | <b>Failures Table</b><br>All recent failures sorted by time. Color-coded status badges tell you instantly which need action (red = urgent, green = resolved).       |
| 3 | <b>Left Navigation</b><br>Access all MAIA screens: Failures, Recommendations, Scan Jobs, Config, and Audit Log.                                                     |
| 4 | <b>Review → Button</b><br>Click this on any failure row to open the full Failure Detail screen.                                                                     |

- Start every shift by checking the KPI cards. If Active Failures is red or growing, click into Failures immediately.

## 4 Responding to a Failure — Step by Step

This is the most common task you will perform. Follow these steps whenever a new failure appears.

|   |                                                                                                                                                             |
|---|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | <b>Open the Dashboard</b><br>Navigate to MAIA in your browser. Check the Active Failures KPI card.                                                          |
| 2 | <b>Spot failures needing attention</b><br>In the Failures table, look for rows with red or orange status badges. Sort by "Detected At" to see newest first. |
| 3 | <b>Click "Review →"</b><br>Click the Review button on the failure you want to investigate. This opens the Failure Detail screen.                            |
| 4 | <b>Read the error context</b><br>Review the Job Name, Error Type, Step Name, and the raw Error Message. This tells you what broke and where.                |
| 5 | <b>Check AI Recommendations</b><br>Scroll down to the Recommendations section. MAIA will suggest one or more fixes with confidence scores.                  |
| 6 | <b>Make your decision</b><br>Choose one of: Approve (run fix once), Set Auto-Heal (run fix automatically next time), or Reject (handle manually).           |
| 7 | <b>Confirm resolution</b><br>After approving, watch the status update to "Resolved" in the list. MAIA logs everything automatically.                        |

■ ■ If no recommendations appear, the failure type is new to MAIA. Resolve manually and ask your admin to add a Classification.

■ You can approve a fix and still investigate further — MAIA runs the fix in the background while you continue reviewing.

# 5 The Failure Detail Screen

The Failure Detail screen gives you complete context for a single failure event. Everything you need to understand and fix the problem is here.

Screen 2 — Failure Detail with AI Recommendations and action buttons

## Key areas on this screen:

|   |                                                                                                                                                |
|---|------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | <b>Red header bar</b><br>Shows the job name and error type at a glance. Red = active failure, green = resolved.                                |
| 2 | <b>Detail cards</b><br>Six data points: Job Name, Job Type, Error Type, Step Name, Detected At, Source ID. These tell you exactly what failed. |
| 3 | <b>Error Message panel</b><br>The raw error text from the log file — useful for advanced diagnosis or escalation.                              |

|   |                                                                                                                                              |
|---|----------------------------------------------------------------------------------------------------------------------------------------------|
| 4 | <b>Recommendations section</b><br>AI-generated fix suggestions ranked by confidence score. Higher score = more reliable suggestion.          |
| 5 | <b>Approve button</b><br>Runs the fix immediately as a one-time action. MAIA records this in the audit log.                                  |
| 6 | <b>Auto-Heal button</b><br>Sets this fix to run automatically every time this error occurs in future. No more manual approval needed.        |
| 7 | <b>Reject button</b><br>Marks the recommendation as rejected. MAIA notes your decision and marks the failure as requiring manual resolution. |

## 6 Working with Recommendations

The Recommendations screen shows all pending suggestions across all failures. Use this as a batch processing view when you have multiple failures to handle.

Screen 3 — Recommendations list with confidence bars and auto-heal toggles

### Understanding Confidence Scores:

| Score Range | Colour   | What it means                        | Suggested Action                      |
|-------------|----------|--------------------------------------|---------------------------------------|
| 85% – 100%  | ■ Green  | High confidence — MAIA is very sure  | Safe to approve or set auto-heal      |
| 70% – 84%   | ■ Orange | Moderate — likely correct but verify | Review the error message first        |
| Below 70%   | ■ Red    | Low confidence — uncertain match     | Investigate manually before approving |

# 7 Setting Up Auto-Heal

Auto-heal is the most powerful feature in MAIA. Once enabled for an error type, MAIA will fix that error automatically — you will never need to manually approve the same fix twice.

## When to enable auto-heal:

|   |                                                                                                                                             |
|---|---------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | <b>You have approved the same fix 2+ times</b><br>This is a strong signal the fix is reliable and the error is recurring. Enable auto-heal. |
| 2 | <b>Confidence score is 85% or above</b><br>High-confidence recommendations are safe candidates for automation.                              |
| 3 | <b>The fix is reversible or low-risk</b><br>Retry-type fixes and stored procedures are ideal. Be more cautious with script-based fixes.     |
| 4 | <b>The error is well-understood</b><br>You know why it happens and the fix always works. Auto-heal is appropriate.                          |

## How to enable auto-heal:

|   |                                                                                                                                    |
|---|------------------------------------------------------------------------------------------------------------------------------------|
| 1 | <b>Find the recommendation</b><br>Go to the Recommendations screen or open the Failure Detail page.                                |
| 2 | <b>Click "■ Auto-Heal"</b><br>Click the blue Auto-Heal button on the recommendation.                                               |
| 3 | <b>Confirm</b><br>A confirmation dialog will appear. Click Confirm to activate.                                                    |
| 4 | <b>Verify the toggle</b><br>The toggle on the Recommendations list will turn green and show "ON".                                  |
| 5 | <b>Next time this error occurs</b><br>MAIA will detect it, classify it, and run the fix automatically — no action needed from you. |

■ Auto-heal actions are always logged in the Audit Log, so you can review every automated fix that ran. Nothing is a black box.

■ If an auto-heal fix fails, MAIA marks the failure as ManualRequired and notifies you. The system will never silently fail.

## 8 Reviewing the Audit Log

The Audit Log is an immutable record of everything that happened in MAIA — every detection, classification, fix attempt, and operator decision. It cannot be edited or deleted.

The screenshot shows the MAIA Audit Log interface. On the left is a dark sidebar with navigation links: Dashboard, Failures, Recommendations, Scan Jobs, Config, and Audit Log. The main area displays a table titled 'MAIA — Audit Log' with the subtitle 'Immutable record of all system and operator actions'. The table has columns: Timestamp, Entity, Action, Triggered By, Details, and Result. The 'Action' column contains color-coded buttons: DETECTED (red), GENERATED (blue), APPROVED (green), EXECUTED (green), RESOLVED (green), AUTO\_HEAL\_SET (teal), and CREATED (blue). Annotations include: a red box pointing to the bottom row stating 'Immutable — entries cannot be edited or deleted'; a blue box pointing to the 'EXECUTED' button stating 'Color-coded actions show what happened at a glance'; and a legend box stating '■ = automated by MAIA' and '■ = human operator action'.

| Timestamp | Entity             | Action        | Triggered By         | Details                                                     | Result   |
|-----------|--------------------|---------------|----------------------|-------------------------------------------------------------|----------|
| 08:12:55  | JobFailure         | DETECTED      | System (Auto)        | ETL_Daily_Load — CONNECTION_TIMEOUT                         | New      |
| 08:12:57  | AIRecommendation   | GENERATED     | System (Auto)        | Retry DB Connection (conf. 0.92)                            | Created  |
| 08:13:44  | AIRecommendation   | APPROVED      | operator@company.com | Operator approved one-time fix                              | Approved |
| 08:13:45  | FixExecution       | EXECUTED      |                      | ApiCallExecutor → POST /api/retry                           | Success  |
| 08:13:47  | JobFailure         | RESOLVED      | System (Auto)        | ■ = automated by MAIA<br>■ = human operator action resolved | Resolved |
| 08:45:12  | OperatorAction     | AUTO_HEAL_SET | operator@company.com | Auto-heal enabled for CONNECTION_TI                         | Enabled  |
| 09:05:33  | ClassificationRule | CREATED       | admin@company.com    | New rule: TIMEOUT_PATTERN added                             | Created  |

Screen 4 — Audit Log showing system and operator actions

### How to use the Audit Log:

1

#### Check who did what

Each entry shows whether the action was performed by MAIA (■ System Auto) or a human operator (■).

2

#### Trace a failure end-to-end

Filter by Entity ID or Job Name to see the complete timeline of a specific failure from detection to resolution.

3

#### Compliance reporting

Export the log or share with management to prove every fix was recorded and traceable.

4

#### Investigate unexpected changes

If something was changed or a fix ran unexpectedly, the audit log will show exactly when and why.

## 9 Configuring a New Job (Admin)

If you have admin access, you can add new pipelines for MAIA to monitor entirely through the web UI — no database access required.

The screenshot shows the 'Add New Monitored Job' configuration form in the MAIA web UI. The form is titled 'Add New Monitored Job' and is located under the 'Config' menu. It contains several sections:

- Basic Information:** Includes fields for 'Job Name \*', 'Job Type \*', 'Description', and 'Scan Type'. A red arrow points to the 'Job Name \*' field, and a blue arrow points to the 'Scan Type' dropdown. A red box highlights the asterisk on 'Job Type \*' with the text 'Required fields marked with \*'. A blue box highlights the 'Scan Type' dropdown with the text 'ScanType dropdown changes which fields appear below'.
- Scan Configuration:** Includes fields for 'Log Folder Path \*', 'Search Patterns', and 'Polling Interval (sec)'.
- Check Rules:** A table with columns: Column, Check Type, Min, Max, Expected, and an 'Add Rule' button. The table contains one row: 'RowCount', 'Range', '100', '50000', and '-'.
- Auto-Heal Policy:** A section with a green background. It includes a checkbox 'Enable auto-heal for:' and a slider. A green arrow points to the slider with the text 'Check "auto-heal eligible" per error type - MAIA will fix automatically'.

At the bottom of the form are two buttons: 'Save Job' and 'Cancel'.

Screen 5 — Add New Monitored Job configuration form

### Configuration steps:

1

#### Navigate to Config → Monitored Jobs

Click Config in the left nav, then select Monitored Jobs.

2

#### Click "Add New Job"

Opens the form shown above.

3

#### Fill in Basic Information

Job Name (unique), Job Type (e.g. DTSX), Description, and select the Scan Type.

4

#### Configure the Scan Source

For FileSystem: enter the log folder path and file patterns. For Database: connection and table name. For API: endpoint URL.

5

**Add Check Rules**

Define what counts as a failure (e.g. row count must be between 100 and 50,000).

6

**Set Auto-Heal Policy**

Check which error types should be eligible for automatic fixing.

7

**Click Save Job**

MAIA picks up the new job on the next 60-second tick and starts monitoring immediately.

- After saving a new job, go to the Scan Jobs screen to confirm MAIA has started scanning it — you should see a recent "La

# 10 Quick Reference Card

Keep this as a bookmark for daily use.

| Task                              | Where to go                       | What to do                                   |
|-----------------------------------|-----------------------------------|----------------------------------------------|
| Check for new failures            | Dashboard                         | Look at Active Failures KPI → click Review → |
| Understand a failure              | Failure Detail                    | Read error type, step name, error message    |
| Apply a fix once                  | Failure Detail → Recommendations  | Click ✓ Approve                              |
| Automate a recurring fix          | Recommendations screen            | Click ■ Auto-Heal toggle to ON               |
| Reject a suggestion               | Failure Detail or Recommendations | Click ✕ Reject + add a note                  |
| Check what MAIA did automatically | Audit Log                         | Filter by Entity or time range               |
| Add a new job to monitor          | Config → Monitored Jobs → Add New | Fill form, click Save                        |
| See all pending recommendations   | Recommendations screen            | Sort by Confidence desc                      |

## Status Badge Reference:

| Status Badge   | Colour   | Meaning                                            | Action Required?                 |
|----------------|----------|----------------------------------------------------|----------------------------------|
| Failed         | ■ Red    | MAIA detected the failure, not yet classified      | Yes — review urgently            |
| Classified     | ■ Orange | Error type identified, recommendation pending      | Yes — check recommendations      |
| Pending Review | ■ Orange | Recommendation exists, waiting for approval        | Yes — approve or reject          |
| ManualRequired | ■ Red    | Auto-fix failed or was rejected, needs manual work | Yes — fix manually               |
| Auto-Healed    | ■ Green  | MAIA fixed it automatically                        | No — review audit log if curious |
| Resolved       | ■ Green  | Fixed and confirmed resolved                       | No — complete                    |

■ Bookmark the MAIA dashboard URL and check it first thing each morning — 5 minutes of review can prevent hours of pipe
